

Dump platform key (SBK)

To get your platform key use this command in the [tegra30-debrick](#) directory.

```
sudo ./fusee-launcher/fusee-launcher.py --tty ./fusee-launcher/dump-sbk-via-usb.bin
```

Add the `-P` parameter at the end to specify the `product_id` if "No TegraRCM device found" is the output. For the Surface RT 1 this is 7130.

This will output a lot of things. Look for the line with hello world, after that line something like this `b'e57de3bab6cb499d874d5772cb219f0101042c20'`

should show up. Remove the `b`, the two `'` and the last 8 remaining characters. This is your platform key. It is used to encrypt and decrypt the BCT and the firststage bootloader
